

FINAL SYSTEM PITCH

Plus One

Turn a small campus plan **into a real meet-up.**

NO SIGN-UP

NO GROUP CHAT

A GUARDED FIRST STEP

+1

A plan starts with one small signal.

“Study at 7?” becomes an action — not a dead chat.

ONE SIMPLE LOOP

Anonymous identity

A temporary plan. A short chat. A mutual decision.

MOTIVATION

The moment disappears fast.

Students want company — but short plans should not require a long coordination process.

WHY SMALL CAMPUS PLANS DIE

01

Sign-up friction

Creating an account feels like too much work for a 45-minute plan.

“I’ll just skip it.”

02

Coordination drag

A small idea turns into messages, waiting, and a dead group chat.

“Maybe next time.”

03

Safety uncertainty

People need a low-pressure first interaction before a real meet-up.

“Is this comfortable?”

PLUS ONE CHANGES THE FIRST 60 SECONDS

0 sign-ups • 1 clear plan • 5-minute chat • 2-sided agreement

One short loop to a real plan.

The deployed site makes each decision visible, temporary, and deliberate.

- 1 CREATE**
Describe, review, publish.
- 2 DISCOVER**
Filter, pass, or join.
- 3 MATCH**
A private, five-minute chat opens.
- 4 MEET**
Both agree before handoff.

SYSTEM ARCHITECTURE

One managed path from click to handoff.

Django coordinates the user flow; focused services enforce the rules underneath it.

USER ACTIONS

Dashboard

temporary browser identity

AI THAT SUPPORTS THE FLOW

Useful AI. Deterministic backup.

The provider helps with language; product rules keep the system available and safe.

MODEL EVALUATION

We measured. DeepSeek won.

Three providers, the same 550 Plus One cases — 300 parsing • 150 moderation • 100 icebreakers.

OVERALL SCORE — 550 SHARED CASES

0.9167

best on activity parsing —
our core task

~\$0.007

for the full
550-case run

PARSING

DeepSeek 0.917 • OpenAI 0.864 • Doubao 0.847

MODERATION

DeepSeek 0.931 • Doubao 0.928 • OpenAI 0.928

ICEBREAKER

Doubao 0.996 • DeepSeek 0.982 • OpenAI 0.914

The live path is protected by rules, not luck.

Each decisive moment has an explicit state, access, or expiry boundary.

THREE CHECKPOINTS ON THE LIVE PATH

FINAL SYSTEM, NOT JUST SCREENS

What was hardest — and what held.

Building for two anonymous strangers meant every guarantee had to be explicit.

HARD PART 01

Two strangers, one shared state.

Anonymous matching meant every state change needed an explicit guard — nothing could lean on accounts.

STATE PROTECTION

No self-match. No duplicate active match.

No messages after the chat expires.

HARD PART 02

Casual words into safe plans.

“Tonight at 7” had to become a reviewable card — time and place could not be silently guessed.

AI BOUNDARY

Users review every generated detail.

Rules guard time interpretation and safety.

HARD PART 03

A demo that cannot fail live.

A provider outage during the live run was never allowed to break the core flow.

MAINTAINABILITY

Deterministic fallback, services, tests.

Tests make the whole flow easy to verify.

READY FOR THE DEMO

Now we show the system

One complete journey. Two anonymous sessions. One shared plan.

LIVE DEMO CUE: Show the chat, both Agree actions, then the handoff and dashboard.

FUTURE IMPROVEMENTS

From working MVP to a trusted campus tool.

The next version builds trust, context, and relevance around the core flow.

North star: more useful coordination without losing the product's simplicity.

01

Notifications

Match, chat, and expiry alerts

Keep the short window actionable.

02

Safety Console

Report, block, ban, review

More visible trust controls.

03

Campus Context

Better place and route context

Make the handoff easier to use.

04

Smart Match

Rank by interest and time

Make the queue more relevant.
